A protist (/ ' p r oʊ t i s t /) is any eukaryotic organism (that is, an organism whose cells contain a cell nucleus) that is not an animal, plant, or fungus. While it is likely that protists share a common ancestor (the last eukaryotic common ancestor), the exclusion of other eukaryotes means that protists do not form a natural group, or clade. Therefore, some protists may be more closely ...

Six DNA regions were evaluated as potential DNA barcodes for Fungi, the second largest kingdom of eukaryotic life, by a multinational, multilaboratory consortium. The region of the mitochondrial cytochrome c oxidase subunit 1 used as the animal barcode was excluded as a potential marker, because it is difficult to amplify in fungi, often includes large introns, and can be insufficiently variable.

Note that two of the four offspring in the above cross have white flowers. Now you know that the offspring in the second row must have the  $pp$  genotype. One of their  $p$  alleles obviously comes from the white-flowered ( $pp$ ) parent, because that's the only allele this parent has. The other  $p$  allele must come from the purple-flowered parent. Therefore, the parent with purple flowers must have the ...
