Immunity and Immunization . According to the World Health Organization (WHO), "immunization is the process whereby a person is made immune or resistant to an infectious disease, typically by the administration of a vaccine. Vaccines stimulate the body's own immune system to protect the person against subsequent infection or disease."

## **The Difference Between Immunization and Vaccination**

The most important vaccines ever. For scientists around the world, the race is on to develop a vaccine for the coronavirus. Designing and testing a vaccine is a slow process — but once a vaccine is available, it will slow the spread of the virus, limit the need for self-isolation, and allow the world to get back to life as normal.

The World Health Organization (WHO) reports that licensed vaccines are currently available for twenty-five different preventable infections. [11] The terms vaccine and vaccination are derived from Variolae vaccinae (smallpox of the cow), the term devised by Edward Jenner (who both developed the concept of vaccines and created the first vaccine) to denote cowpox .

## **Vaccine - Wikipedia**

Vaccination is the administration of a vaccine to help the immune system develop protection from a disease. Vaccines contain a microorganism or virus in a weakened, live or killed state, or proteins or toxins from the organism. In stimulating the body's adaptive immunity, they help prevent sickness from an infectious disease. When a sufficiently large percentage of a population has been ...
